
Audi Q3 Sportback with 48 Volt Mild-Hybrid-System

For the market launch in Europe, a gasoline and a diesel engine are available for selection for the Audi Q3 Sportback. Additional engines will follow in the course of the year, including a more powerful diesel and an entry-level gasoline engine, which works together with a 48 V mild-hybrid system.

During deceleration, it recovers energy; during acceleration from low speeds, it supports the engine. In real-life driving, it can save up to 0.4 l of fuel per 100 km (62.1 mi).
